

RADIOFRY

Signal analysis report

Evidence-first interpretation of a captured RF signal

Generated 2026-09-12T19:15:20.919827+00:00

Source: TEST | unknown samples

Confidence is evidence, not protocol verification. Human review remains part of the result.

Executive result

Measure	Result
Decision	Unclassified
Fused trust score	0.0%
CNN model confidence	0.0%
Review status	REVIEW REQUIRED
Protocol verification	Not established

Interpretation

The result packages independent measurements, model evidence, and explicit uncertainty. Use the detailed pages to inspect waveform evidence and decoding limitations.

RadioFry Signal Analysis Report

Formal evidence summary generated from the analyzed capture

Generated: 2026-09-12T19:15:20.919827+00:00

Source: test | samples: unknown

Measured sample rate: unknown

Modulation decision: Unclassified

CNN confidence: 0.0%

Fused trust score: 0.0%

Carrier frequency: unknown Hz

Occupied bandwidth: unknown Hz

Estimated SNR: unknown dB

Estimated symbol rate: unknown Hz

Symbol-rate confidence: 0.0%

Sync pattern: not detected

Score definitions

CNN confidence is the model softmax probability. Fused trust score combines CNN confidence with independent classical family agreement. These values are intentionally different.

Scope: the production CNN is a synthetic-domain digital classifier; real-world accuracy and out-of-distribution correctness are not established. Human review remains required.

CNN prediction unavailable

Decoded Evidence

Interleaver prediction: unavailable

Selected interleaver: unknown

FEC prediction: unavailable

Selected FEC: unknown

FEC success: False

Recovered bits: 0

Header bits: 0

Payload bits: 0
